AMENDMENTS TO THE SPECIFICATION

Please replace the abstract with the following amended paragraph marked up to show changes made relative to the immediate prior version:

~~Systems and methods are provided to facilitate location of a communication network subscriber via a home location privacy server.~~ According to ~~one embodiment~~ <u>some embodiments</u> , a home database server receives a network address request (*e.g.*, a request associated with an attempt by a client device to locate a subscriber device). The home database server ~~responds~~ <u>may respond</u> to the network address request by transmitting a privacy server network address. The home location privacy server may then receive a location request, evaluate privacy information associated with the subscriber device, and, depending on the results of the evaluation, provide the subscriber location directly or indirectly to the client device.
